

Search Problems

Russell and Norvig:
Chap. 3, Sect. 3.1 – 3.2

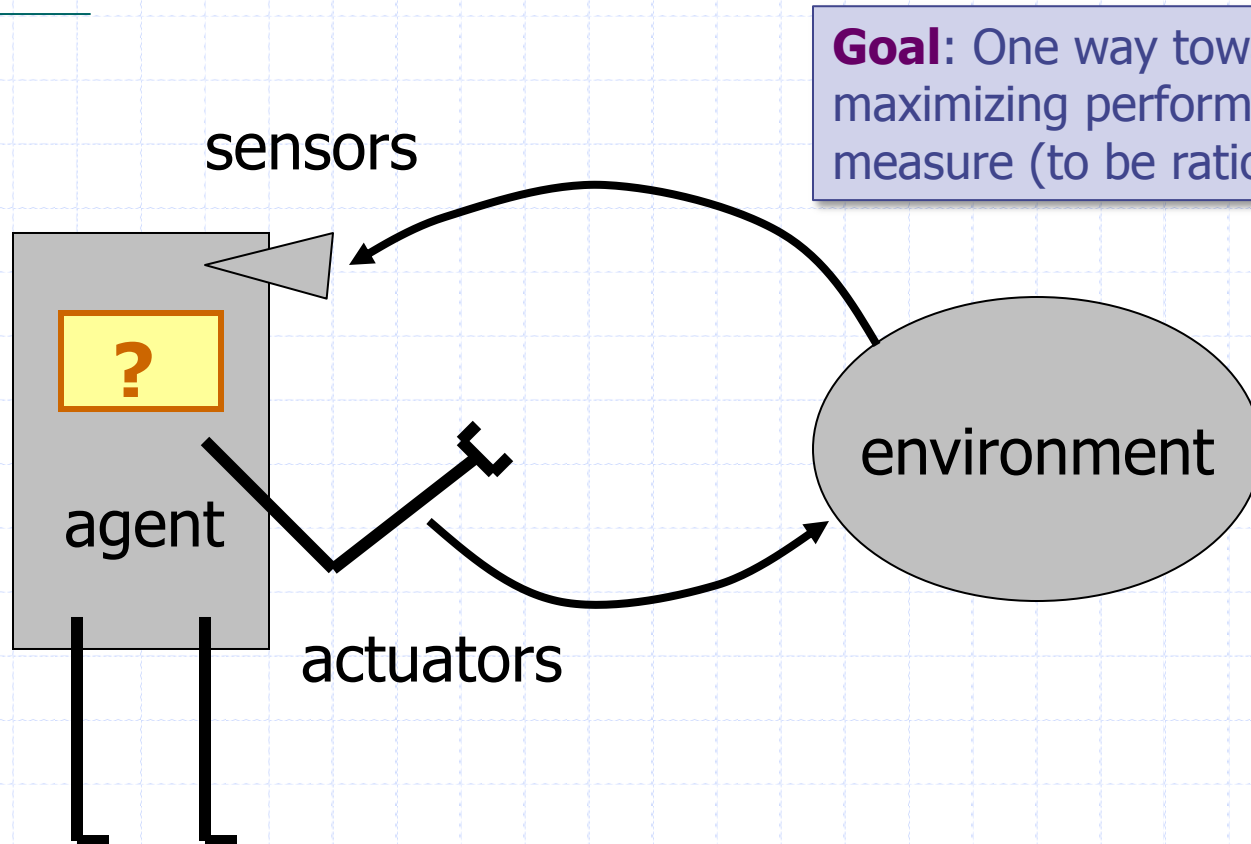

Slides by Jean-Claude Latombe, from an introductory AI course given at Stanford University (used with permission).

Goal-Based Agent

Goal: One way towards maximizing performance measure (to be rational)

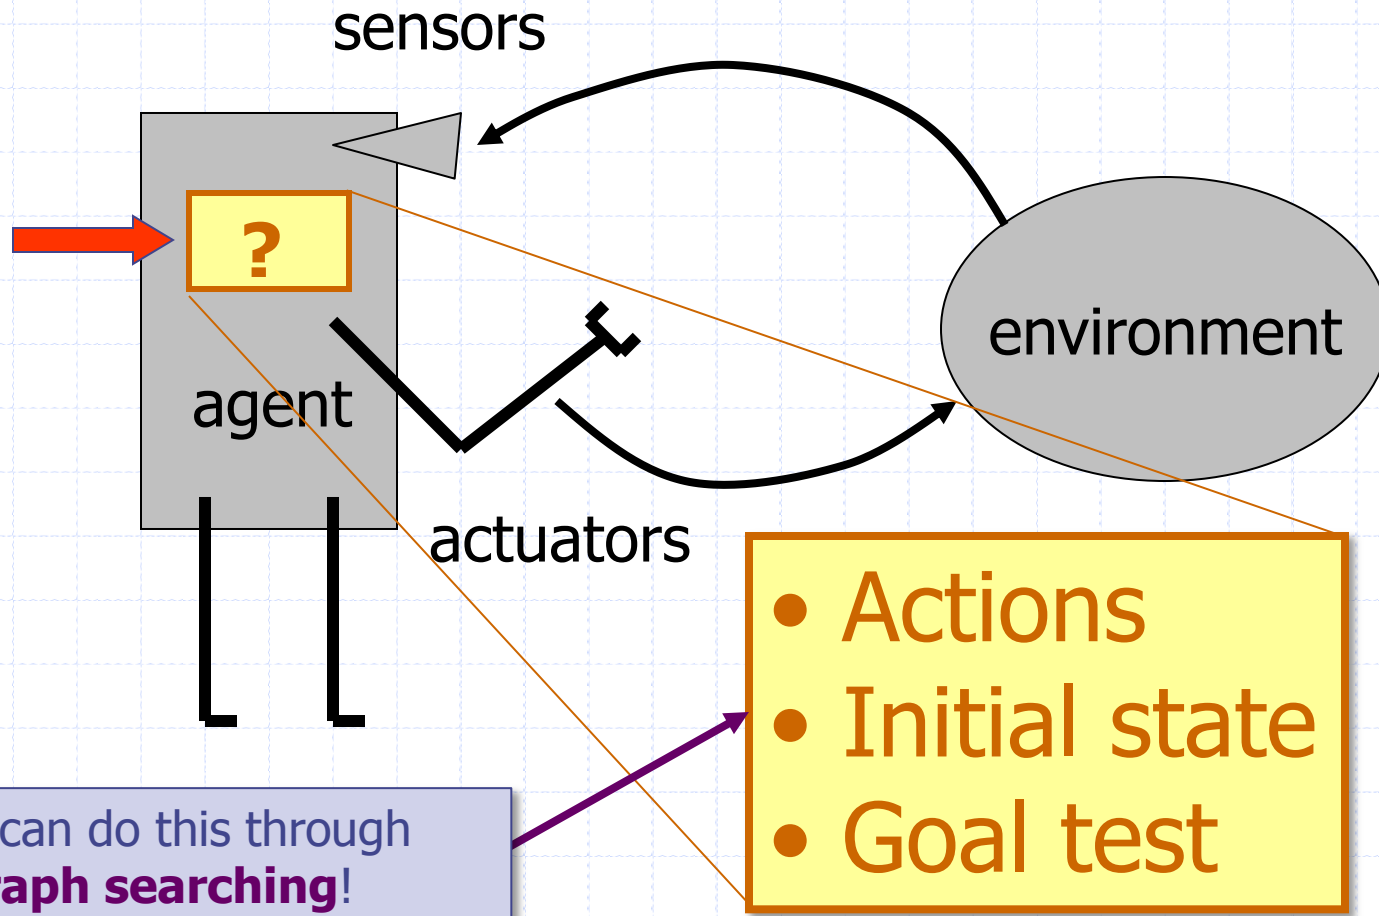

Goal-Based Agent

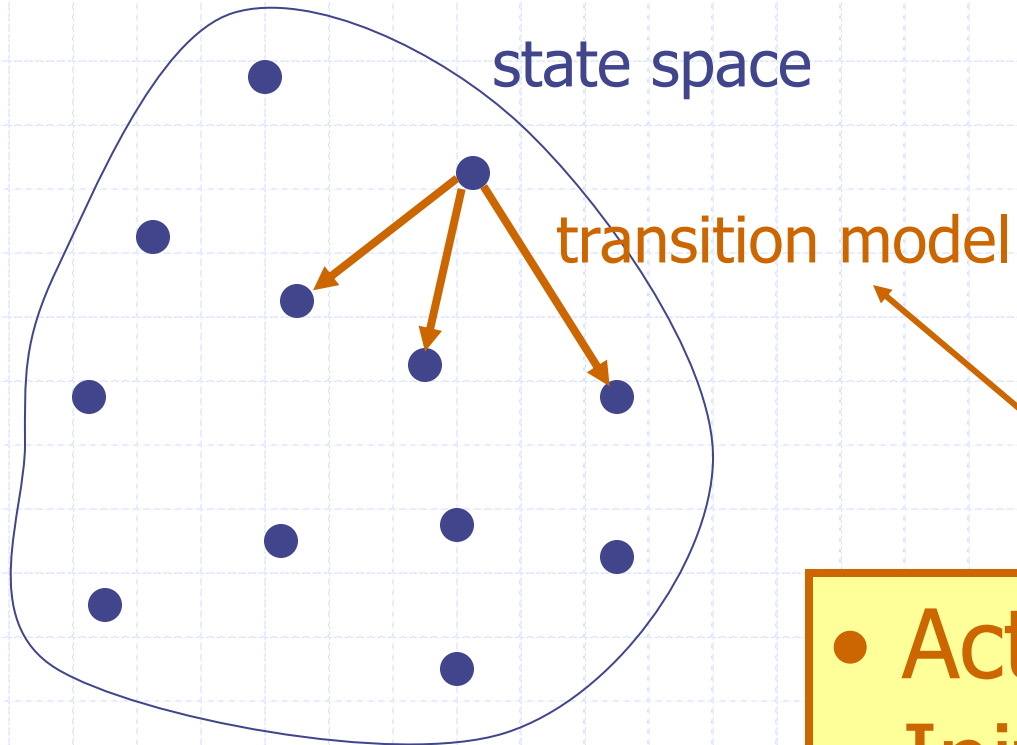

Goal: One way towards maximizing performance measure (to be rational)

Can it find a **sequence of actions** achieving its goals, when no single action will do?

Problem-Solving Agent

Problem as a Search Problem

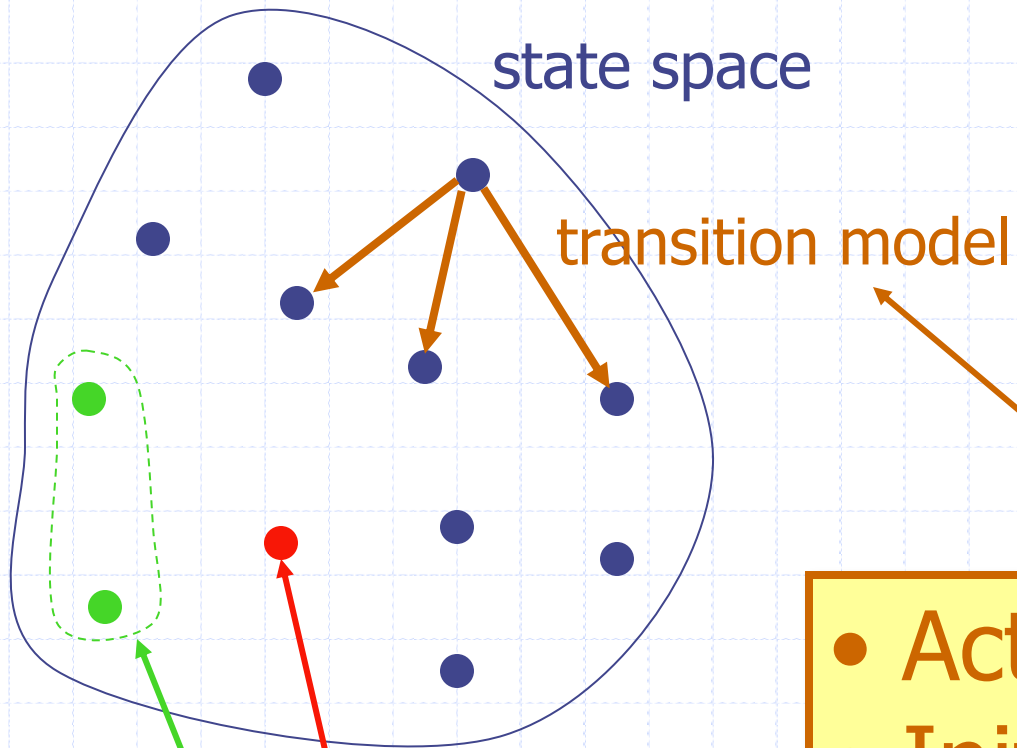

- Actions
- Initial state
- Goal test

Initial State

- Actions
- Initial state
- Goal test

Goal Test

- Actions
- Initial state
- Goal test

Example: 8-puzzle

| | | |
|---|---|---|
| 8 | 2 | |
| 3 | 4 | 7 |
| 5 | 1 | 6 |

Initial state

| | | |
|---|---|---|
| 1 | 2 | 3 |
| 4 | 5 | 6 |
| 7 | 8 | |

Goal state

State: Any arrangement of 8 numbered tiles and an empty tile on a 3x3 board

Example: 8-puzzle

Action set and transition model is knowledge about the 8-puzzle game, but it does not tell us which transition to take.

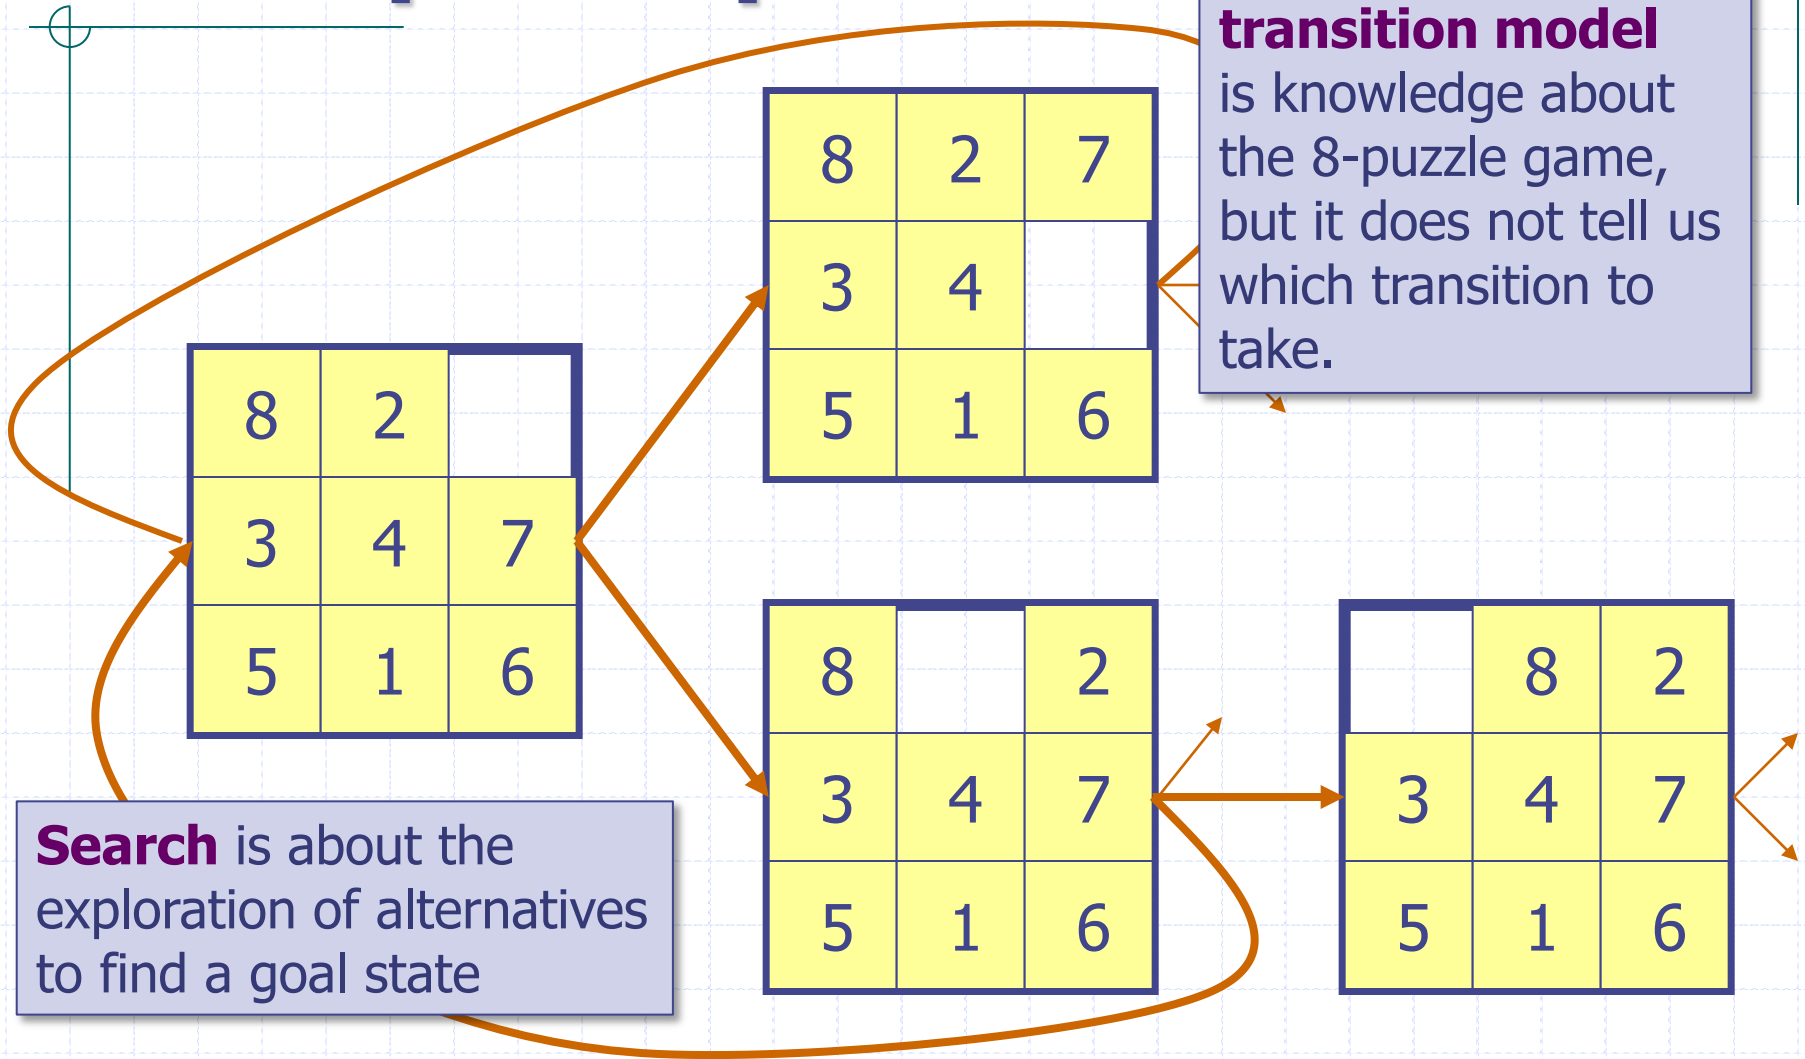

| | | |
|---|---|---|
| 8 | 2 | |
| 3 | 4 | 7 |
| 5 | 1 | 6 |

| | | |
|---|---|---|
| 8 | 2 | 7 |
| 3 | 4 | |
| 5 | 1 | 6 |

| | | |
|---|---|---|
| 8 | | 2 |
| 3 | 4 | 7 |
| 5 | 1 | 6 |

| | | |
|---|---|---|
| | 8 | 2 |
| 3 | 4 | 7 |
| 5 | 1 | 6 |

Search is about the exploration of alternatives to find a goal state

Example: 8-puzzle

Size of the state space = $9! = 362,880$ (but half reachable)

15-puzzle ▶ $\sim 2 \times 10^{13}$

24-puzzle ▶ $\sim 1 \times 10^{25}$

40 billion years

24 days

0.36 sec

10 millions states/sec

Search of State Space

Search of State Space

Search of State Space

Search Problem

- ◆ Initial state
- ◆ Actions
- ◆ Transition model
- ◆ State space
- ◆ Goal test
- ◆ Path cost

Search Problem

- ◆ Initial state:
 - ◆ usually the current state
 - ◆ sometimes one or several hypothetical states (“what if ...”)
- ◆ Actions
- ◆ Transition model
- ◆ State space
- ◆ Goal test
- ◆ Path cost

Search Problem

- ◆ Initial state
- ◆ **Actions:**
 - ◆ possible actions available to agent
- ◆ Transition model
- ◆ State space
- ◆ Goal test
- ◆ Path cost

Search Problem

- ◆ Initial state
- ◆ Actions
- ◆ Transition model:
 - ◆ Result of doing action in state
 - ◆ Successor:
reachable state by single action from current state
- ◆ State space
- ◆ Goal test
- ◆ Path cost

Search Problem

- ◆ Initial state
- ◆ Actions
- ◆ Transition model
- ◆ **State space** (implicitly defined by the above):
 - ◆ each state is an abstract representation of the environment
 - ◆ the state space is discrete
- ◆ Goal test
- ◆ Path cost

Search Problem

- ◆ Initial state
- ◆ Actions
- ◆ Transition model
- ◆ State space
- ◆ Goal test:
 - ◆ sometimes the description of a state
 - ◆ usually a condition
- ◆ Path cost

Search Problem

- ◆ Initial state
- ◆ Actions
- ◆ Transition model
- ◆ State space
- ◆ Goal test
- ◆ Path cost:
 - ◆ [path ▶ positive number]
 - ◆ usually, path cost = sum of step costs
 - ◆ e.g., number of moves of the empty tile

Simple Agent Algorithm

Problem-Solving-Agent

1. formulate: (abstraction!)

1. initial-state ◀ sense/read state
2. goal ◀ select/read goal
3. actions ◀ select/read action models
4. transition model ◀ select/read model
5. problem ◀ (initial-state, goal, actions, transition model)

2. solution ◀ search(problem)

3. perform(solution)

Example: 8-queens

Place 8 queens in a chessboard so that no two queens are in the same row, column, or diagonal.

A solution

Not a solution

Example: 8-queens

Formulation #1:

- **States:** any arrangement of 0 to 8 queens on the board
- **Initial state:** 0 queens on the board
- **Actions:** add a queen in any empty square
- **Transition model:** board contains queen
- **Goal test:** 8 queens on the board, none attacked

► 64^8 states with 8 queens

Example: 8-queens

Formulation #2:

- **States:** any arrangement of $k = 0$ to 8 queens in the k leftmost columns with none attacked
- **Initial state:** 0 queens on the board
- **Actions:** add a queen to any square in the leftmost empty column **such that it is not attacked** by any other queen
- **Transition model:** board contains queen
- **Goal test:** 8 queens on the board

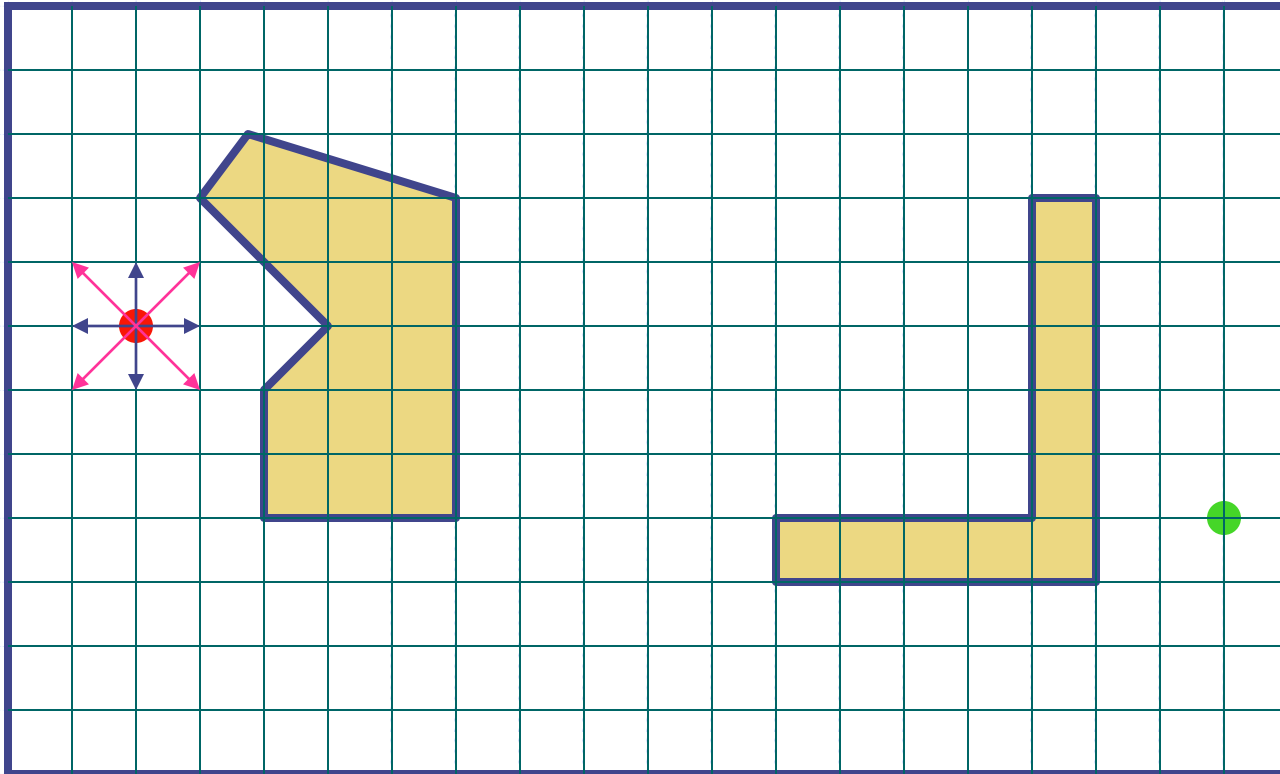

▶ 2,057 states

Example: Robot navigation

What is the state space?

Example: Robot navigation #1

Cost of one horizontal/vertical step = 1

Cost of one diagonal step = $\sqrt{2}$

Example: Robot navigation #1

This path is the shortest in the discretized state space, but not in the original continuous space

Example: Robot navigation #2

Example: Robot navigation #2

Example: Robot navigation #2

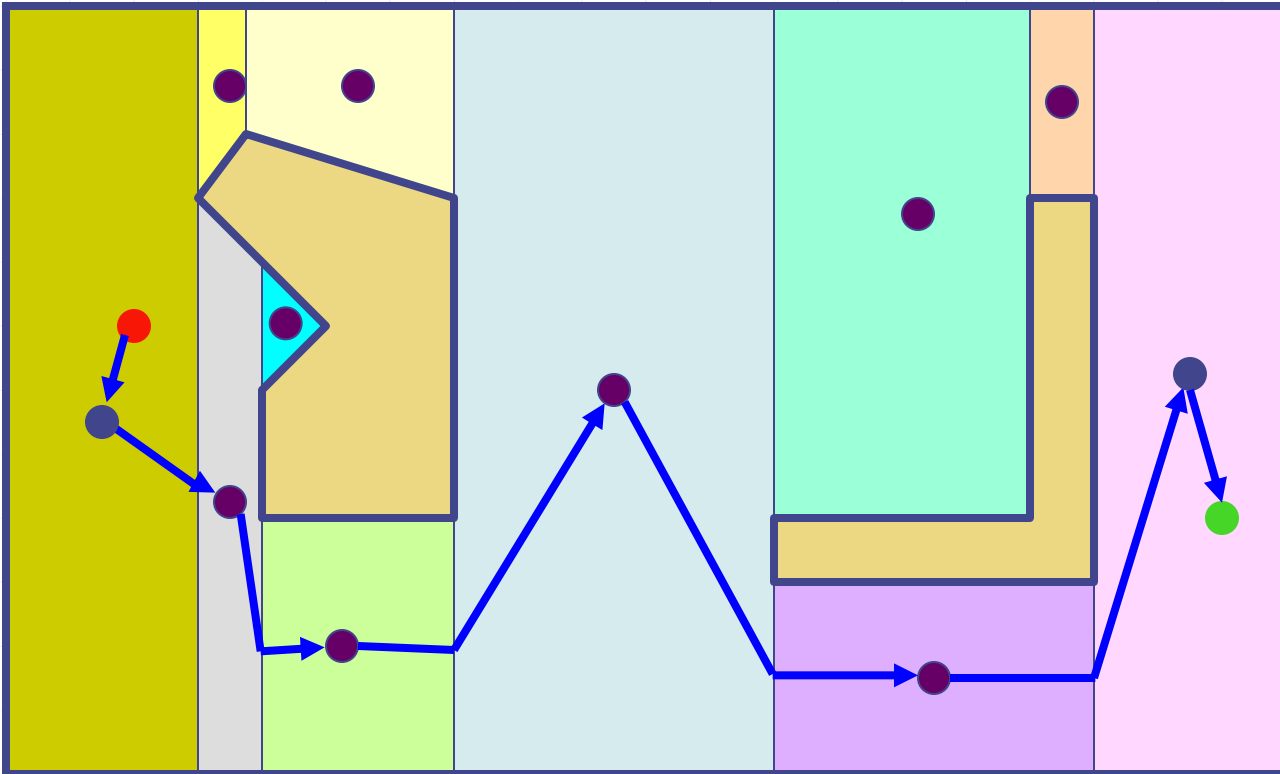

states

Example: Robot navigation #2

transition model

Example: Robot navigation #2

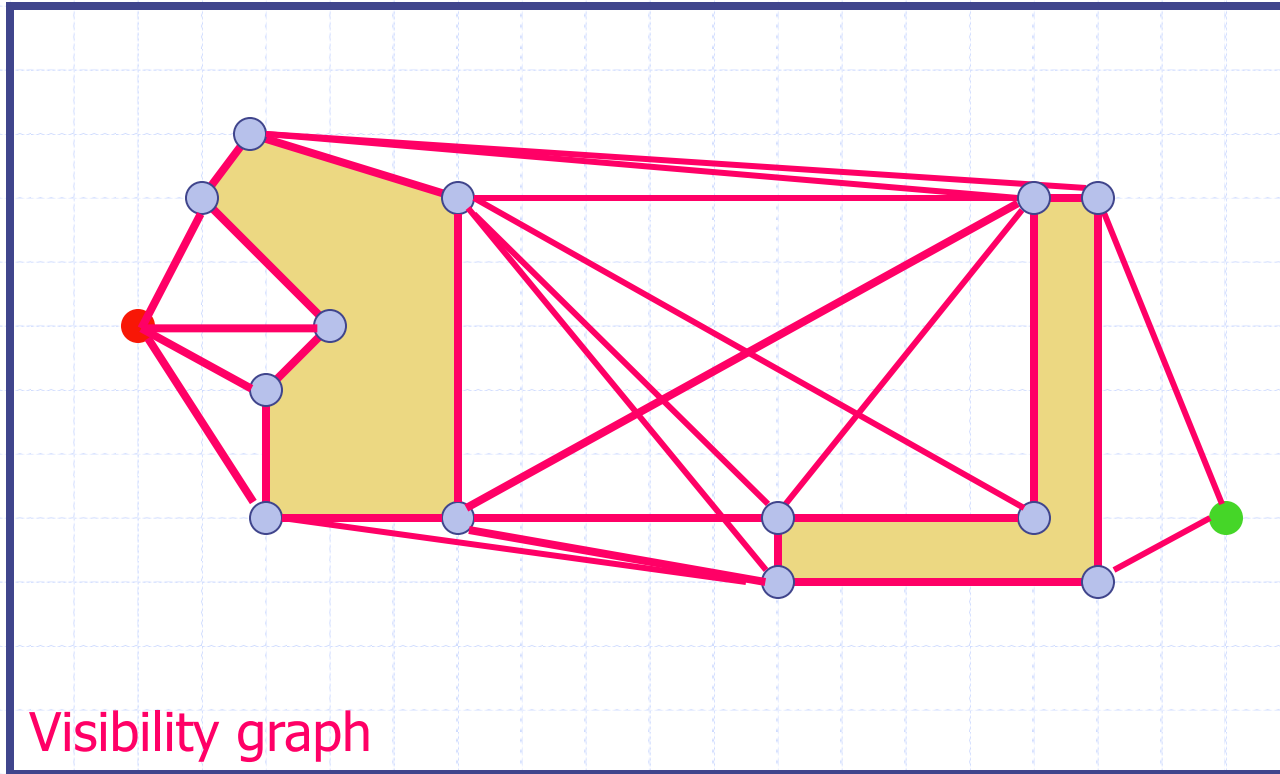

A path-smoothing post-processing step is usually needed to shorten the path further

Example: Robot navigation #3

Cost of one step: length of segment

Example: Robot navigation #3

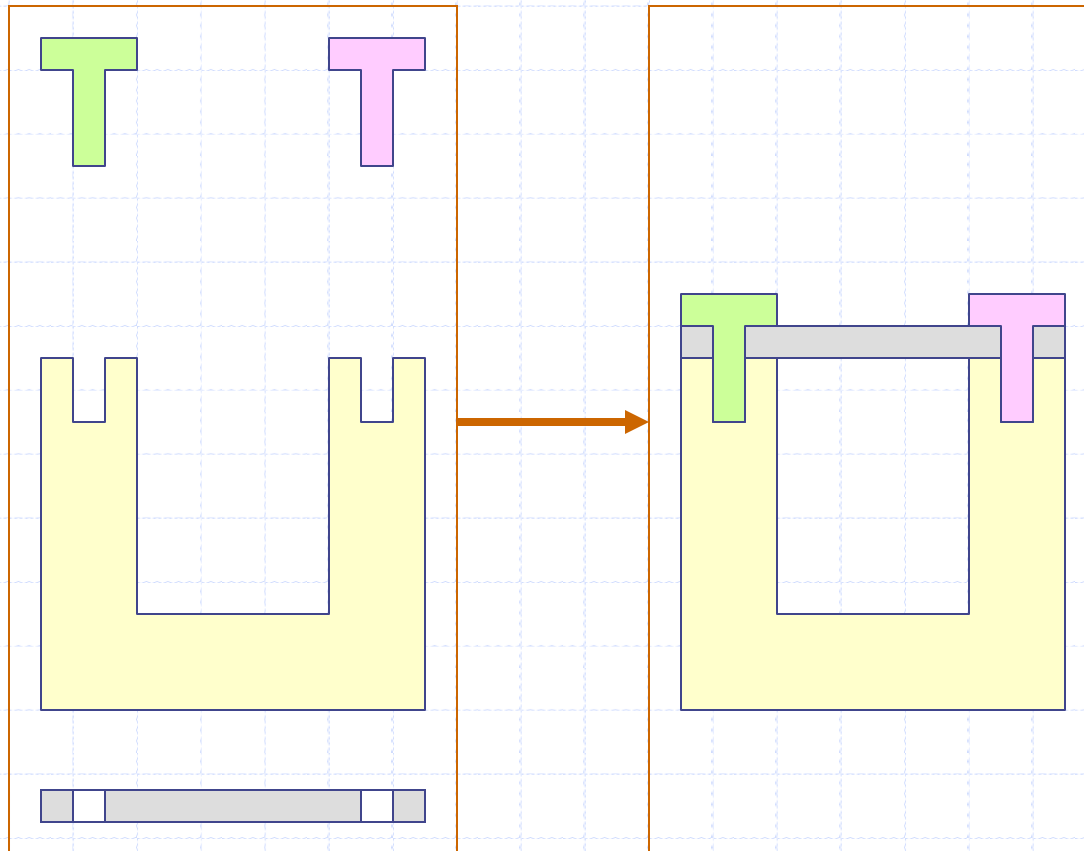

Cost of one step: length of segment

Example: Robot navigation #3

The shortest path in this state space is also the shortest in the original continuous space

Example: Assembly Planning

Example: Assembly Planning

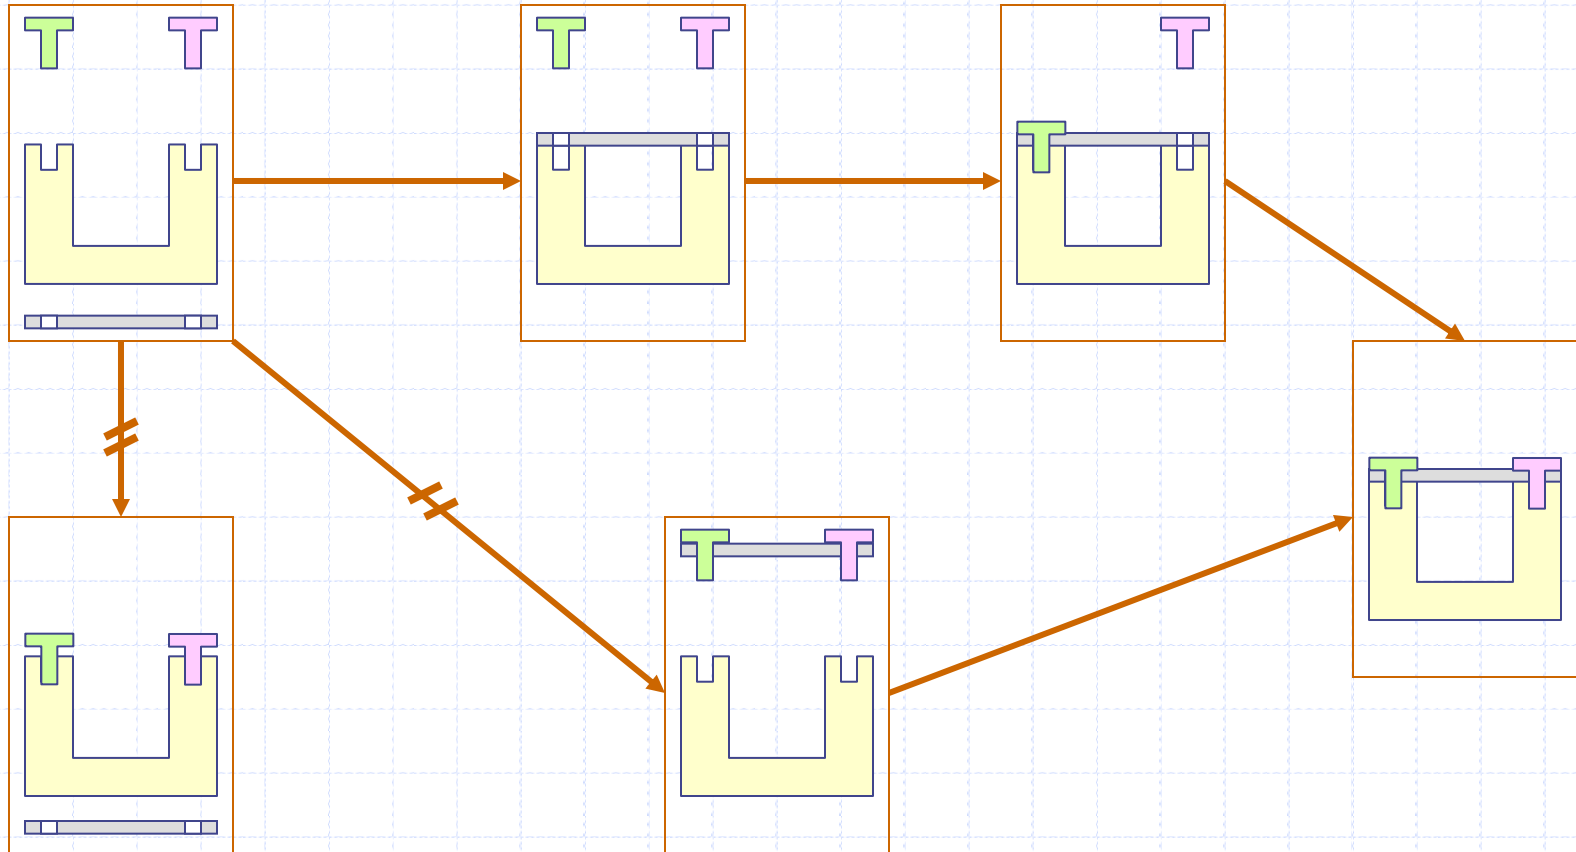

Example: Assembly Planning

- **State:** Collection of sub-assemblies
- **Initial state:** All sub-assemblies are individual parts

- **Goal state:** Complete assembly
- **Actions:** Merge two subassemblies (check for collision)
- **Transition model:** Merged assembly
- **Cost function:** Longest sequence of assembly operation

Example: Assembly Planning

Assumptions in Basic Search

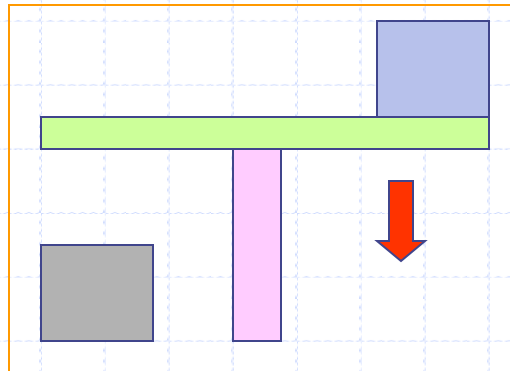

- ◆ The environment is static
- ◆ The environment is discretizable
- ◆ The environment is observable
- ◆ The actions are deterministic

Search Problem Formulation

◆ Real-world environment -> Abstraction

Search Problem Formulation

- ◆ Real-world environment -> Abstraction
 - ◆ Validity:
 - ◆ Can the solution be executed?

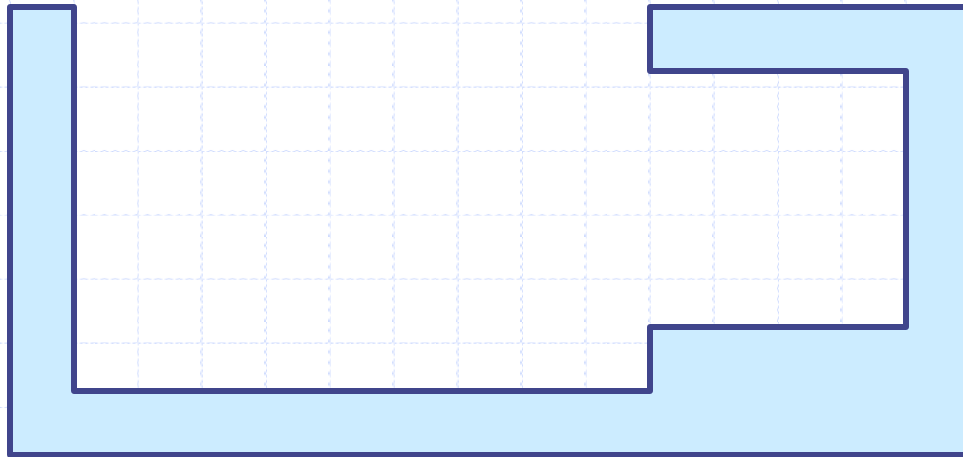

Search Problem Formulation

◆ Real-world environment -> Abstraction

- ◆ Validity:
 - ◆ Can the solution be executed?
 - ◆ Does the state space contain the solution?

Search Problem Formulation

◆ Real-world environment -> Abstraction

- ◆ Validity:
 - ◆ Can the solution be executed?
 - ◆ Does the state space contain the solution?
- ◆ Usefulness
 - ◆ Is the abstract problem easier than the real-world problem?

Search Problem Formulation

- ◆ Real-world environment □ Abstraction
 - ◆ Validity:
 - ◆ Can the solution be executed?
 - ◆ Does the state space contain the solution?
 - ◆ Usefulness
 - ◆ Is the abstract problem easier than the real-world problem?
- ◆ Without abstraction an agent would be swamped by the complexity of the real world

Search Problem Variants

- ◆ One or several initial states
- ◆ One or several goal states
- ◆ The solution is the path or a goal node
 - ◆ In the 8-puzzle problem, it is the path to a goal node
 - ◆ In the 8-queen problem, it is a goal node

Search Problem Variants

- ◆ One or several initial states
- ◆ One or several goal states
- ◆ The solution is the path or a goal node
- ◆ Any, or the best, or all solutions

Important Parameters

◆ Number of states in state space

8-puzzle ▶ 362,880

15-puzzle ▶ 2×10^{13}

24-puzzle ▶ 1×10^{25}

8-queens ▶ 2,057

100-queens ▶ 10^{52}

There exist techniques to solve N-queens problems efficiently!

Stating a problem as a search problem is not always a good idea!

Important Parameters

- ◆ Number of states in state space
- ◆ Distribution of goal states
- ◆ Size of memory needed to store a state

Important Parameters

- ◆ Number of states in state space
- ◆ Distribution of goal states
- ◆ Size of memory needed to store a state
- ◆ Running time of the successor function

Applications

- ◆ Route finding: airline travel, networks
- ◆ Pipe routing, VLSI routing
- ◆ Pharmaceutical drug design
- ◆ Robot motion planning
- ◆ Video games

Summary

- ◆ Problem-solving agent
- ◆ State space, actions, transition model
- ◆ Search!
- ◆ Examples:
 - ◆ 8-puzzle, 8-queens, route finding, robot navigation, assembly planning
- ◆ Assumptions of basic search
- ◆ Important parameters
